

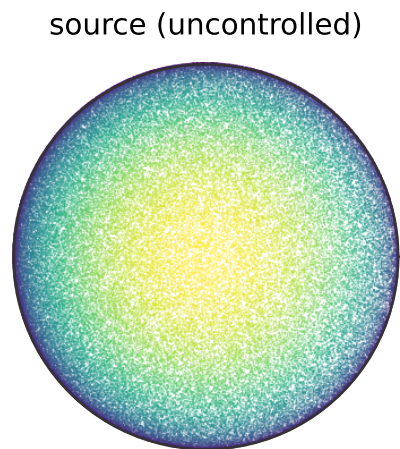

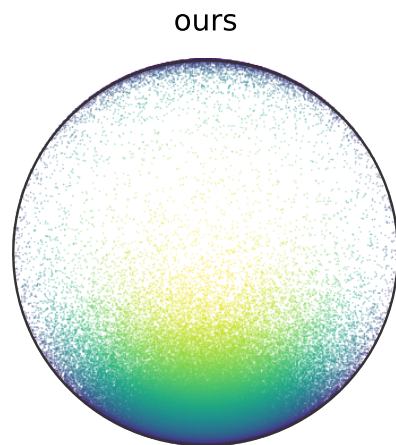

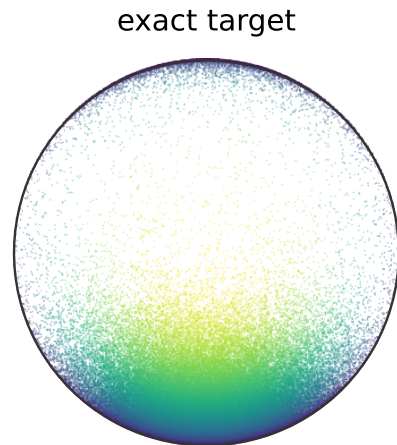

Figure 6 – S^2 : the samples themselves, front hemisphere (source, ours, exact target, residual)

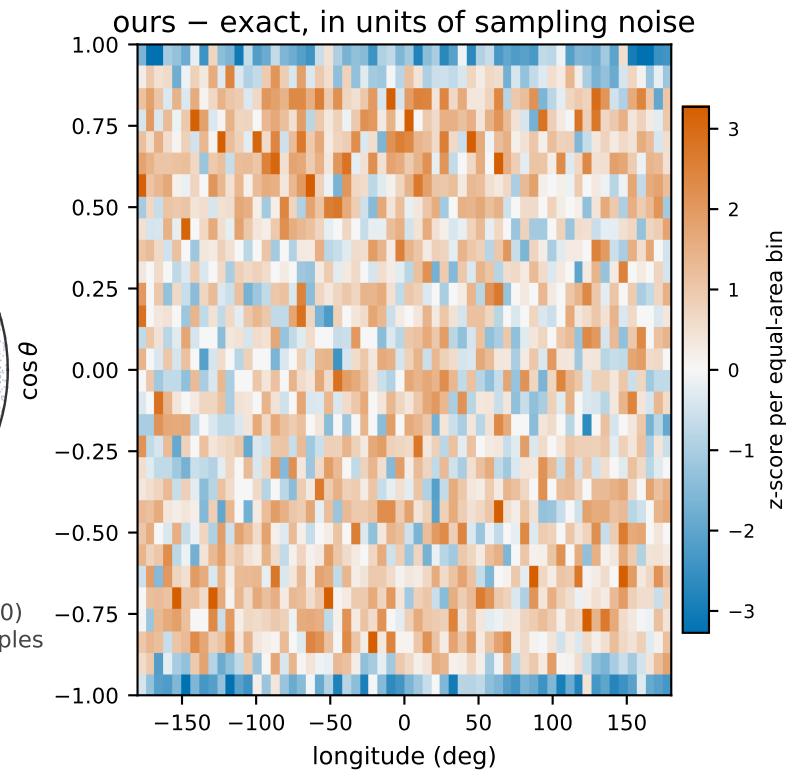

what the bridge starts from
 $KS(x_3) = 0.324$

north mass 0.5011, $KS(x_3) = 0.0220$
 $||x|| - 1| = 2.2e-16$, 200,000 samples

north mass 0.4983 (analytic 0.5000)
 iid inverse-CDF draws, 200,000 samples

99% of 1800 bins within $\pm 3\sigma$, 99.7% expected if the two agree; max $|z| = 4.3$.
 At 200,000 samples a side there is no resolvable structure left in the residual.
